

ABSTRACT

A window blinds slat structure that consists of a knitted fabric, with loops unitarily knitted from the warp yarns or the weft yarns at predetermined intervals apart along the two sides of the slat, the loops enabling the insertion and
5 positioning of long rods at the two sides of the slats. The long rods are inserted such that they are exposed outside the slats, with the slats and the long rods paired in different color combinations for a contrastive, multi-layer look that enhances the aesthetic appearance of the window blinds.
